## Harness the flexibility, power and productivity of IP telephony

TelNet OfficeEdge<sup>SM</sup> SIP Trunking boosts the power of your IP PBX, dynamically providing voice services and Internet and bringing to life your system's full feature functionality. Making the most of your investment, TelNet SIP Trunking is the foundation for deploying innovative, next generation applications.

#### Optimize your network.

Converging your local, long distance and Internet service optimizes the efficiency of your organization's network resources. OfficeEdge SIP Trunking also enables you to consolidate network resources across multiple locations for further simplification and improved return on your investment.

#### Buy only what you need when you need it.

Gain maximum flexibility in configuring service; there's no need to purchase in fixed 23-channel increments. TelNet simply configures additional SIP call paths on your existing Internet connection as your company grows. Plus, our optional Call Bursting feature ensures there is never a busy signal — even during super peak times — without the need and cost of additional trunks.

#### Be prepared.

Our Call Forward Unreachable feature is built in so calls can be automatically redirected to another phone or location during any event that prevents calls from completing at your site. It's a critical part of your company's business continuity plans to ensure you won't miss a call.

#### Maximize opportunities in the Cloud.

Importantly, SIP Trunking lays the foundation for you to access and get the most from Cloud based, IP telephony advances and applications. We make it easy to implement upgrades and new IP-based features across all your locations.
